

Physical Security Control Plan

Step 1

As a member of a cybersecurity team, you work for a corporation bidding on a government contract. All confidential information must remain onsite. Therefore, the contract prohibits saving confidential information to USB flash drives or other removable storage devices usable for transporting files offsite.

The corporation must improve its security measures to prevent this type of data breach.

Currently, the corporation has the following security measures:

- The server room is locked. Each IT staff member has a key to the server room.b
- The door to the shared workspaces is not locked. However, a sign outside this door clearlyb states, “Authorized personnel only”, and a receptionist screens all visitors.b
- All employees have their own usernames and passwords.b
- All employees have been instructed not to plug USB flash drives or external hard disk drivesb into their work computers.b

Your supervisor tasks you with developing a plan for meeting the contract’s requirements.

Insert the picture of your plan below.

Step 2

Identify at least three new physical controls to implement on the first floor. Use the controls and placements that you chose in Step 1.

Explain your reasoning for each control, including its position.

Step 3

Identify three environmental controls to implement on the first floor. These controls must minimize the loss of valuable data in the event of a fire, natural disaster, or power failure.

Explain your reasoning for each choice.
